## U.S. Business Cycle Report

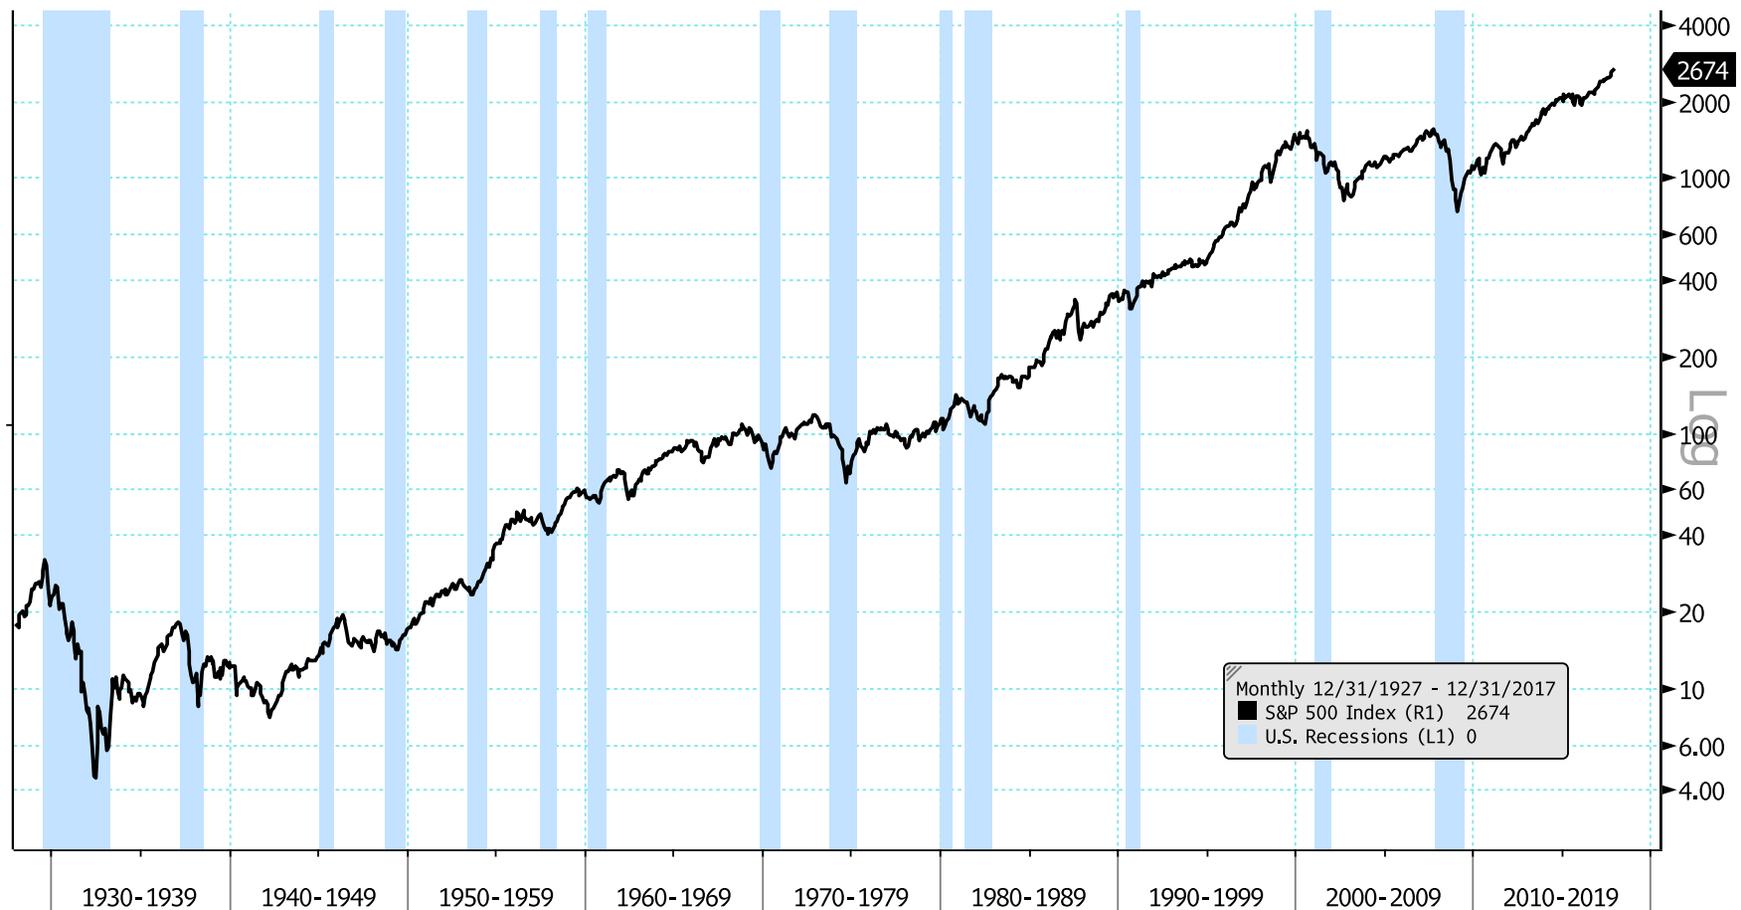

September 2019

Nick Reece, CFA

Senior Analyst & Portfolio Manager, Merk Investments LLC

## Why is the Business Cycle Important?

S&P 500 (log scale) and official National Bureau of Economic Research (NBER) U.S. Recessions

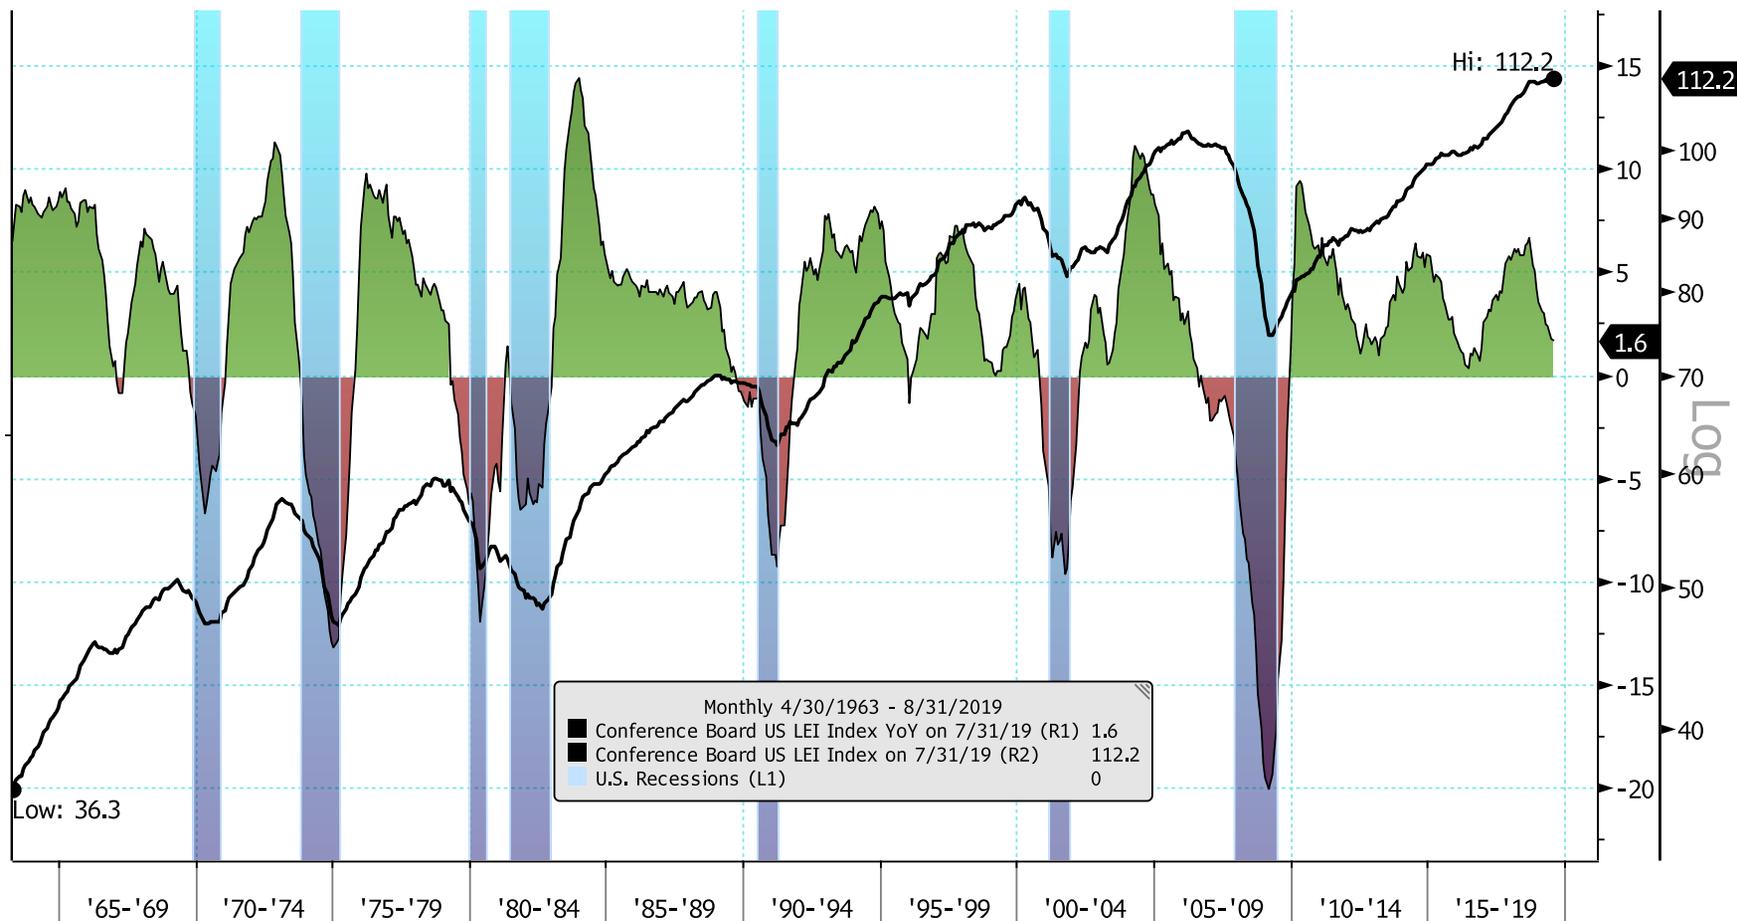

Source: © Merk Investments, Bloomberg

*Analysis: Over the 90 years between 1927 and 2017, the average S&P 500 monthly return during expansions was +0.89% (889 months), compared to an average S&P 500 monthly return during recessions of -0.71% (191 months). In terms of proportions of time: expansion months account for about 80% and recession months about 20%. The business cycle also has important implications for Fed policy. \*Note that recessions are not announced by the NBER until well after their start dates\**

## U.S. Leading Economic Indicators (LEIs) Index

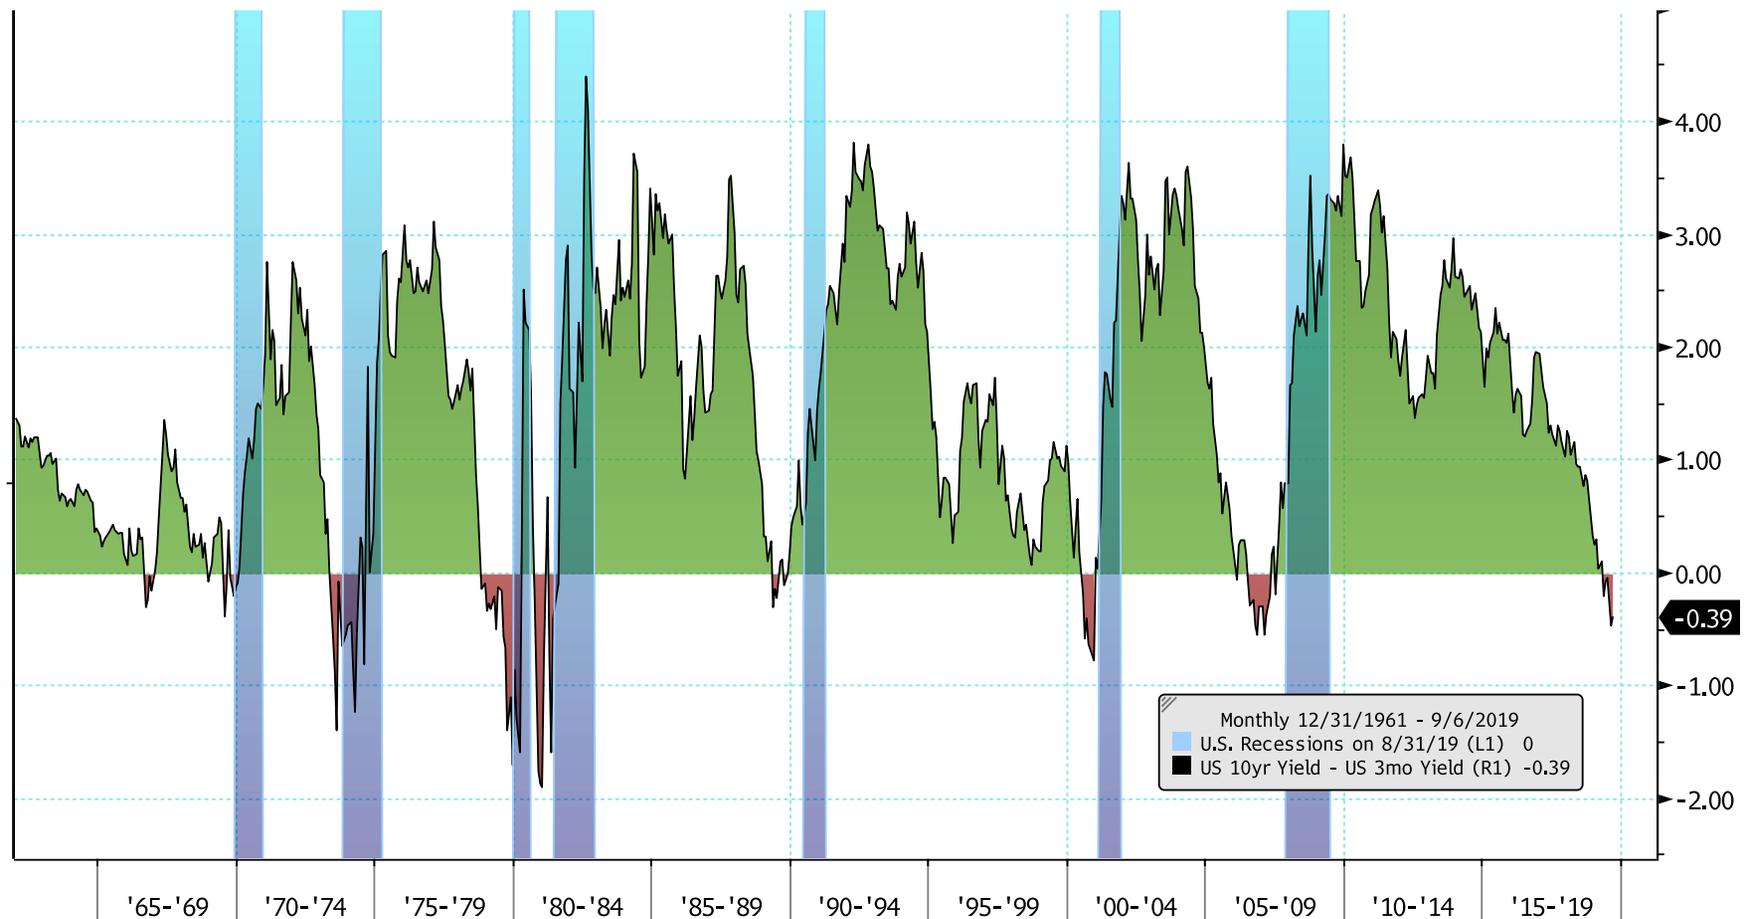

Conference Board's LEI Index and YoY Rate of Change

Source: © Merk Investments, Bloomberg

*Analysis: Since last month's report the LEI YoY rate of change remained stable at +1.6% and the index level made a new all time high. Over the past several months positive momentum has slowed, but given that the YoY rate of change remains positive, history suggests a recession is unlikely to start within the next six months. This picture keeps me generally positive on the outlook for the U.S. economy. Chart Framework: I'd get incrementally negative on the business cycle outlook if the LEI YoY went negative.*

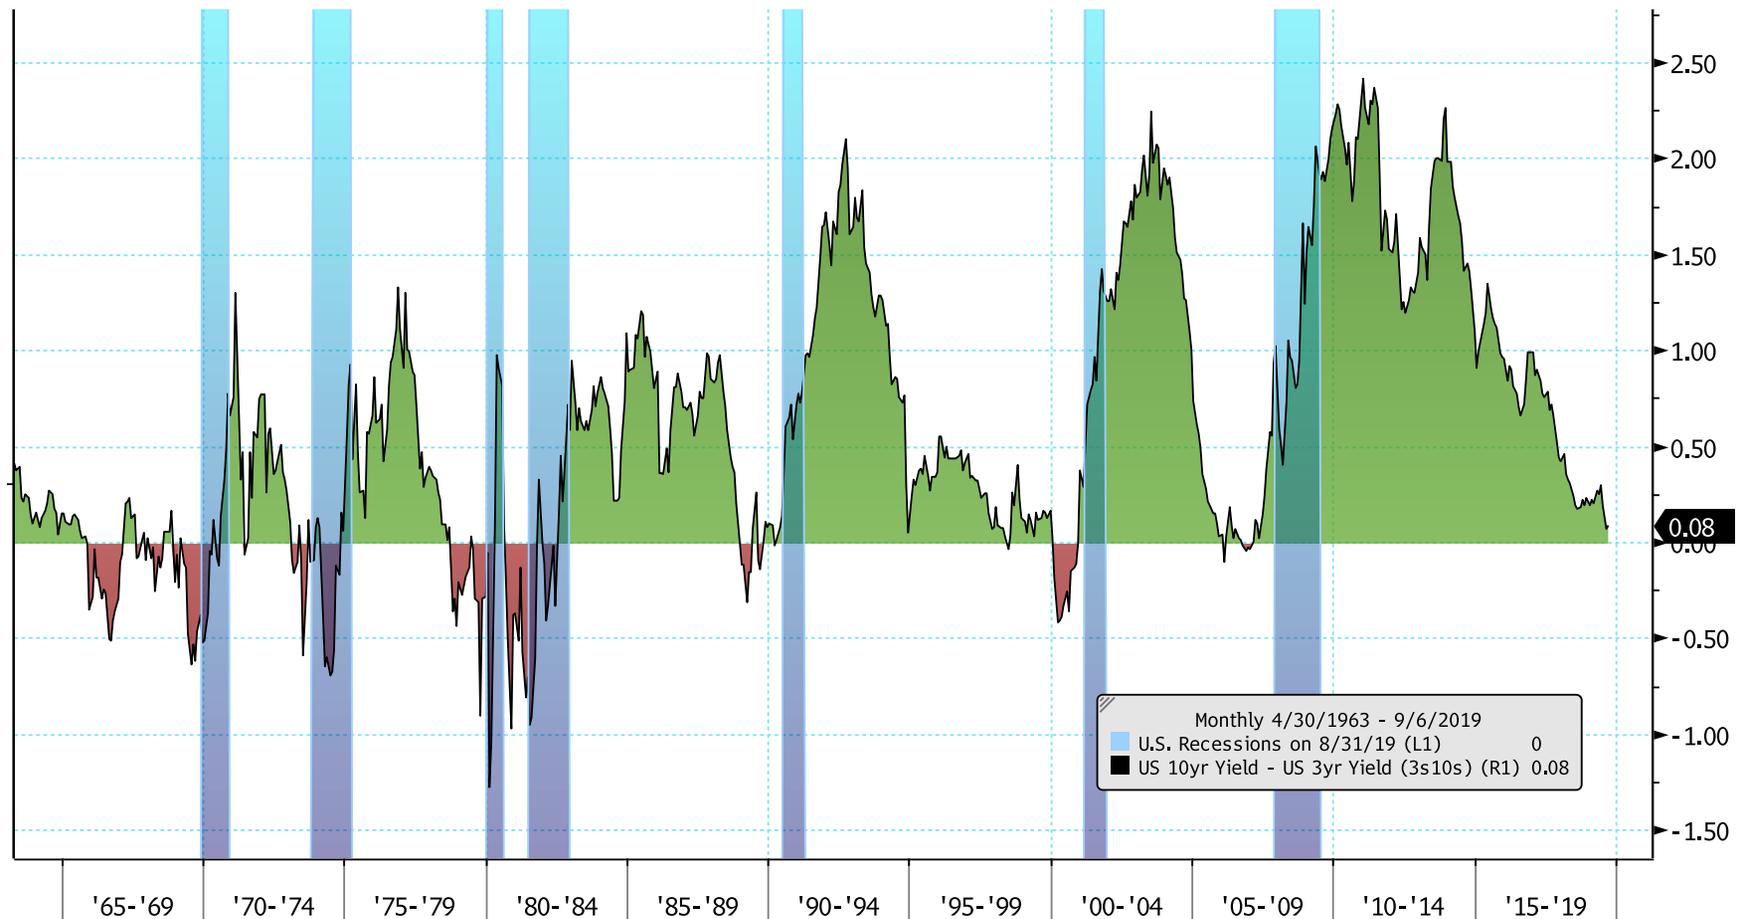

### U.S. Yield Curve Steepness (10yr yield – 3mo yield)

Source: © Merk Investments, Bloomberg

*Analysis: The 10yr-3m yield curve has been inverted (meaning the 3-month yield is higher than the 10-year yield) since May, currently inverted at -39bps. 10yr-3m inversion has historically been a strong recession indicator (with recessions historically starting 6-18 months after initial inversion). I'm currently negative on this picture. Chart Framework: I'd get incrementally positive on this picture if the yield curve uninverted while other macroeconomic data (e.g., U.S Mfg PMI) also improved. \*It may be worth noting that the 10yr-3yr (shown on the next page) has always inverted prior to recessions and still has not (yet) inverted.*

### U.S. Yield Curve Steepness (10yr yield – 3yr yield)

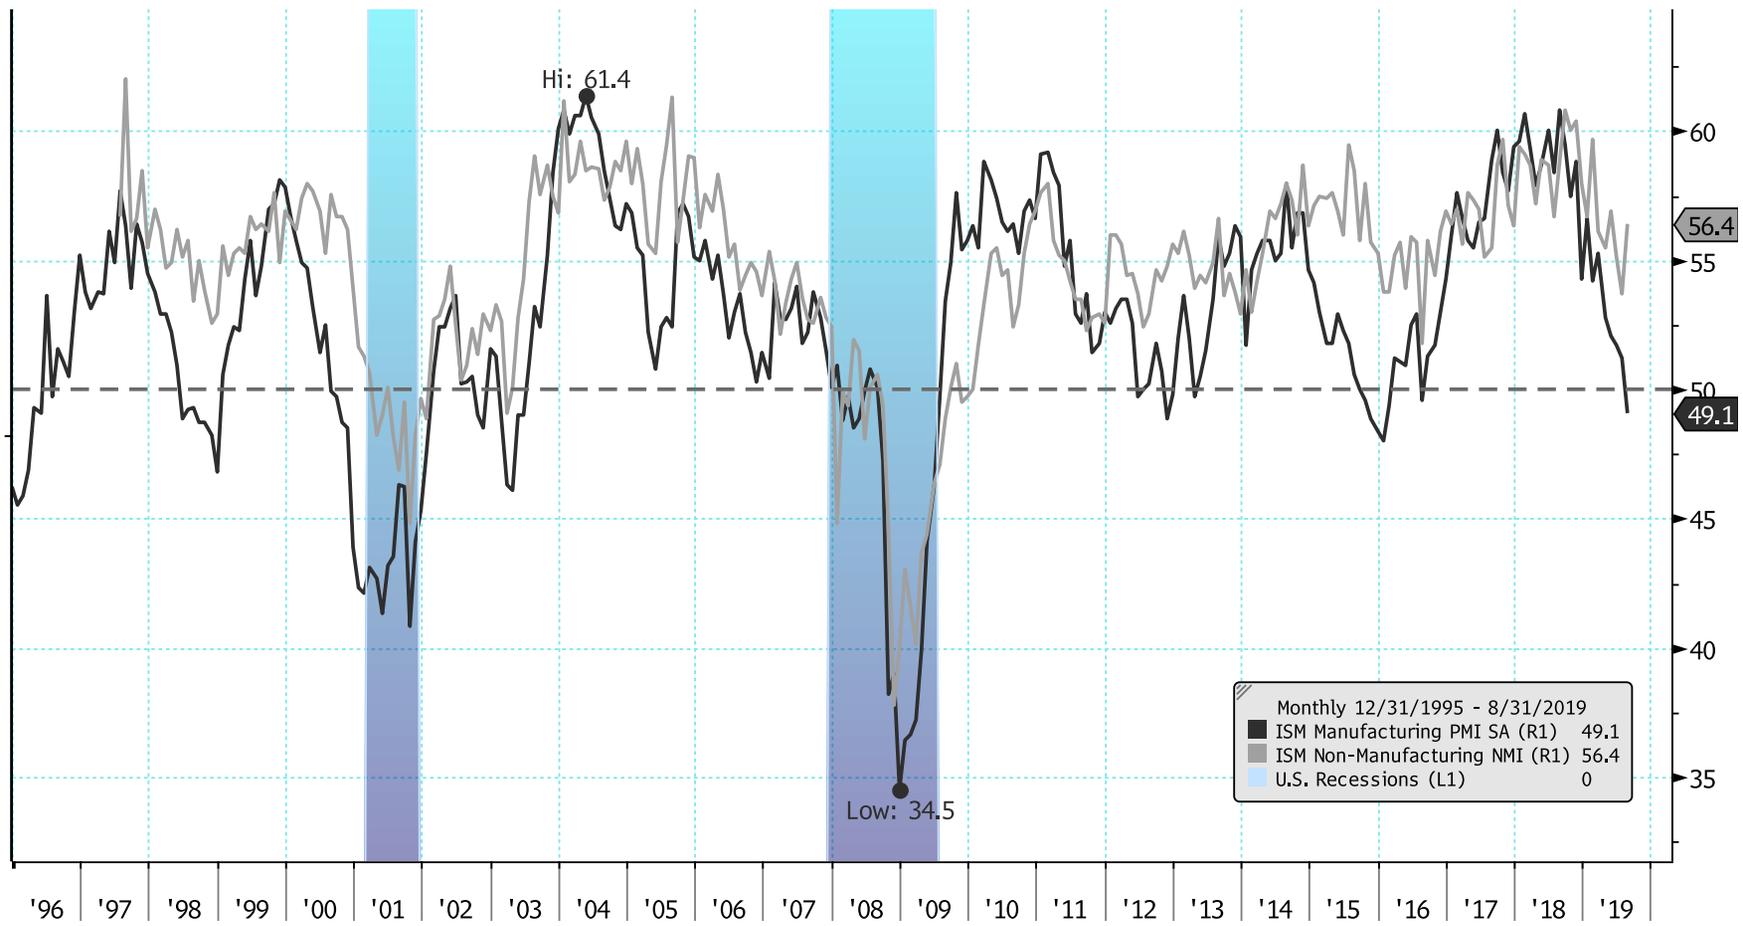

Source: © Merk Investments, Bloomberg

*Analysis: A cross reference to the 10yr-3yr shows a yield curve that is still positively sloped (meaning the 10yr yield is higher than the 3yr yield). The yield curve steepness is flatter since last month's report, and the bigger picture flattening trend has continued. The 10yr-3yr curve may invert in the coming months. Chart Framework: I'd get incrementally negative on the medium term business cycle outlook if the yield curve inverted (i.e., 3yr yield > 10yr yield).*

## U.S. PMIs

Manufacturing and Non-manufacturing (aka Services) PMIs (Purchasing Managers Index)

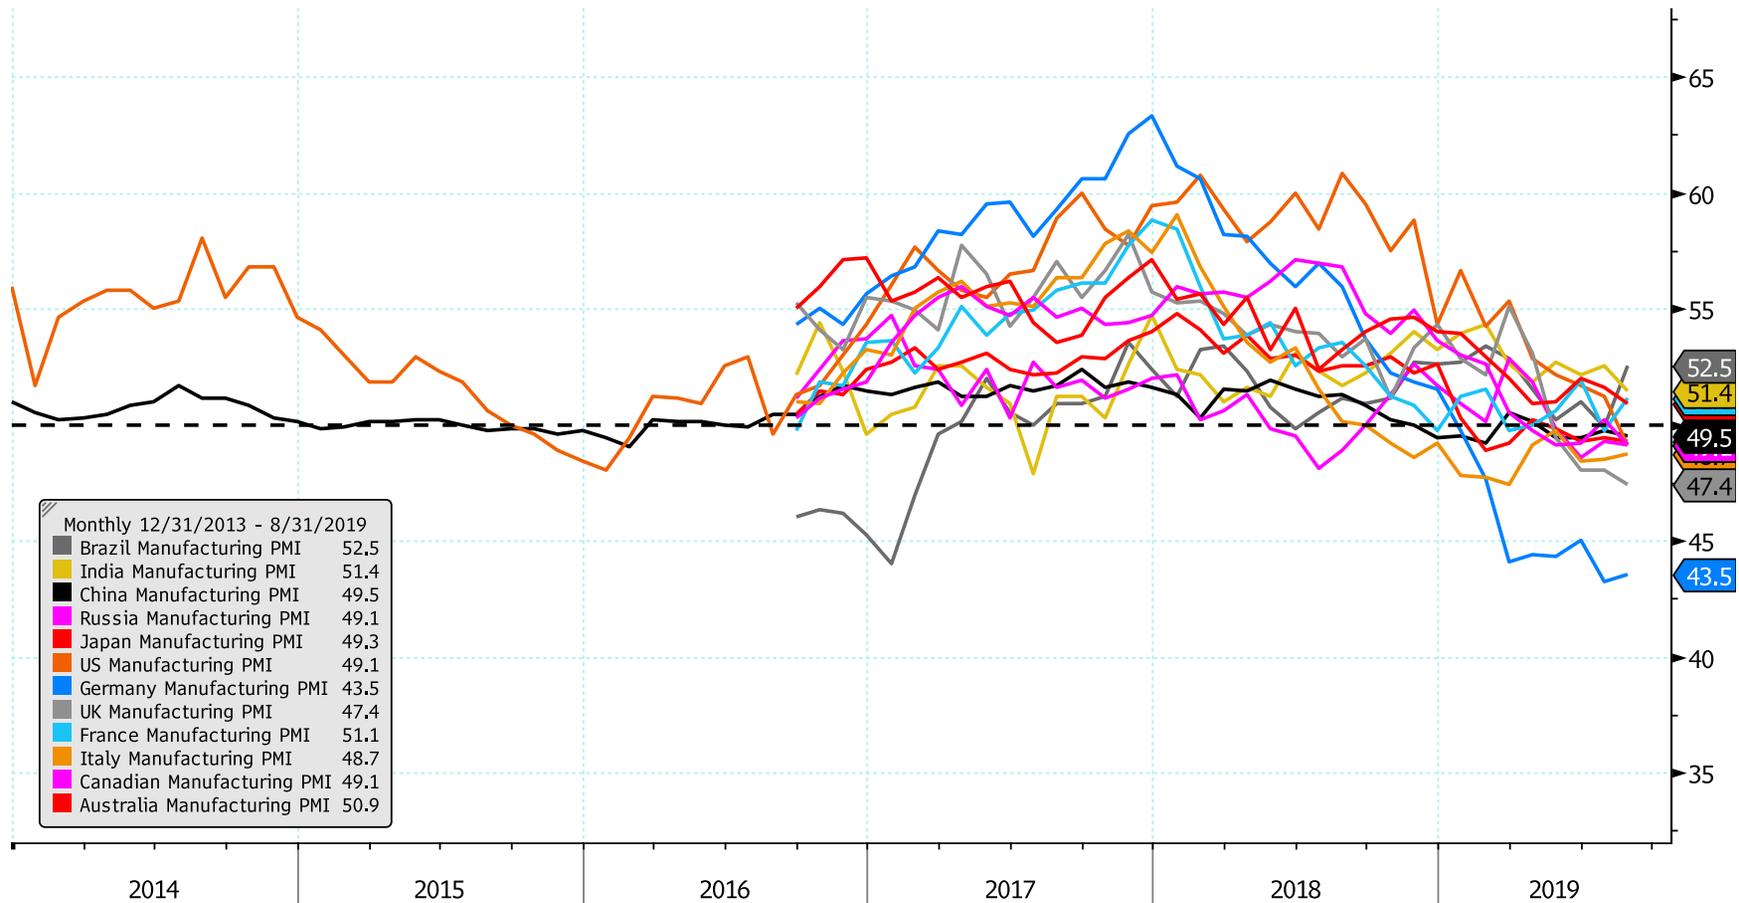

Source: © Merk Investments, Bloomberg

*Analysis: Manufacturing PMI ticked down over the past month, from 51.2 to 49.1, and is now below 50- suggesting economic contraction. I'm currently negative on this picture. Chart Framework: I'd get incrementally positive on the business cycle outlook if the manufacturing PMI rose above 50.*

## Global Manufacturing PMIs

Largest twelve global economies' Manufacturing PMIs (Purchasing Managers Index)

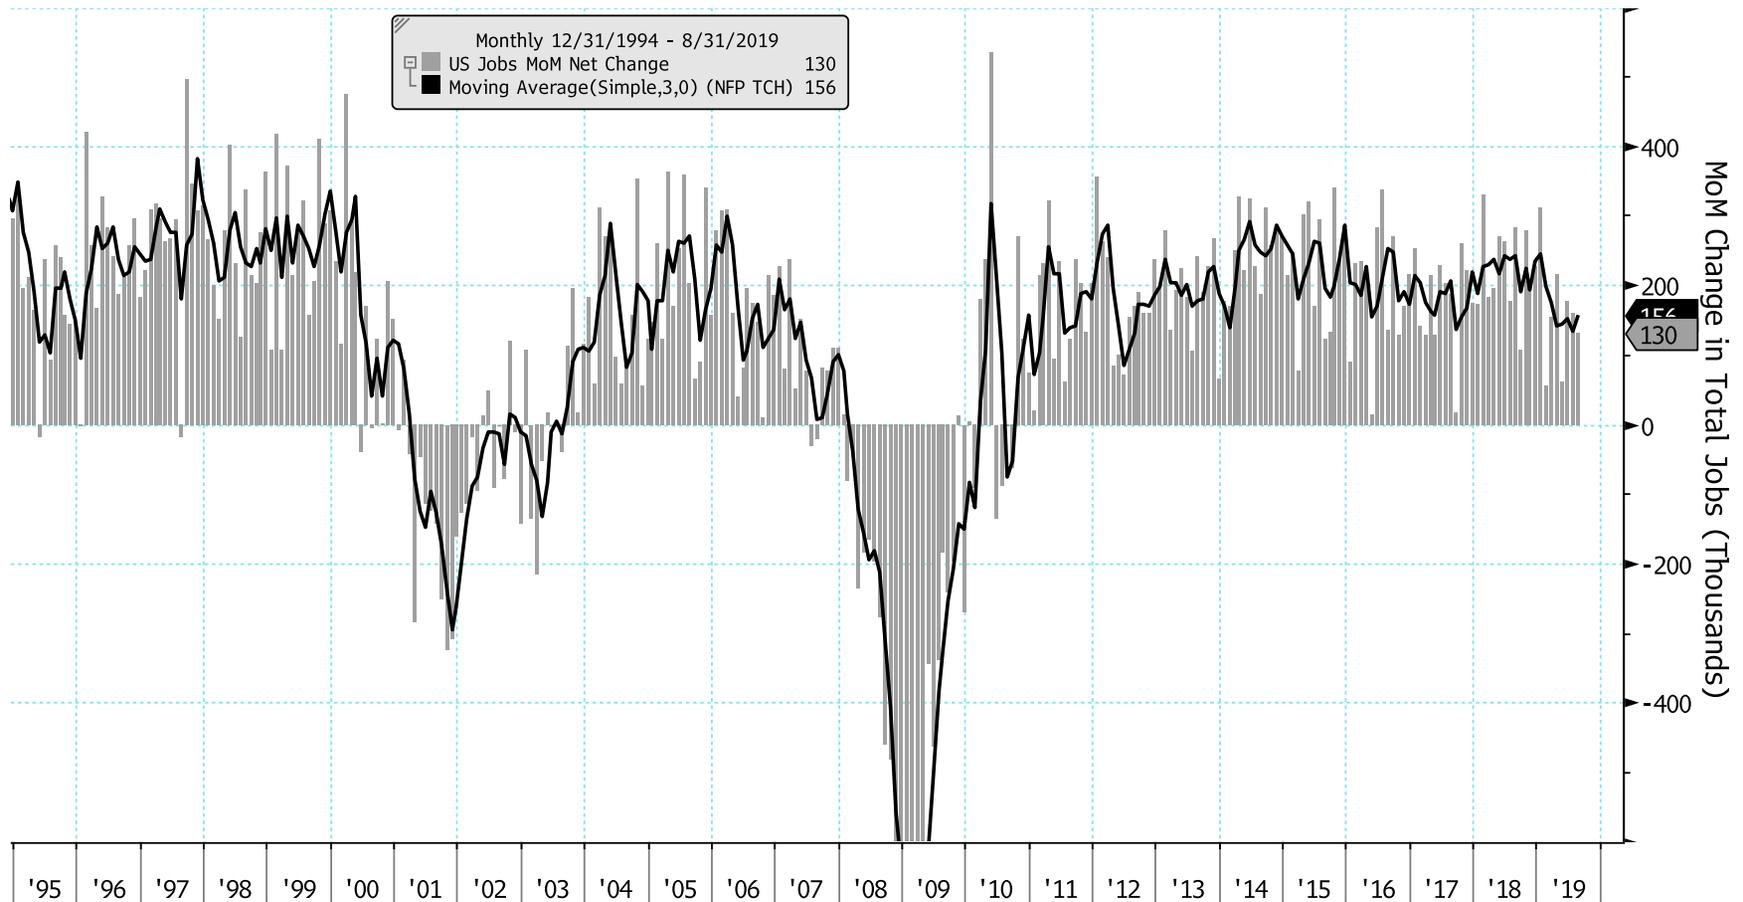

Source: © Merk Investments, Bloomberg

*Analysis: Global economic momentum was mixed over the past month. Eight out of the twelve readings remain below 50, i.e., in contractionary territory. Given my framework I'm negative on this picture. Chart Framework: to get positive on this picture the majority of Mfg PMIs would have to be above 50.*

## Job Gains

The Net Monthly Change in Non-farm Payrolls (grey) with 3-month Moving Average (black)

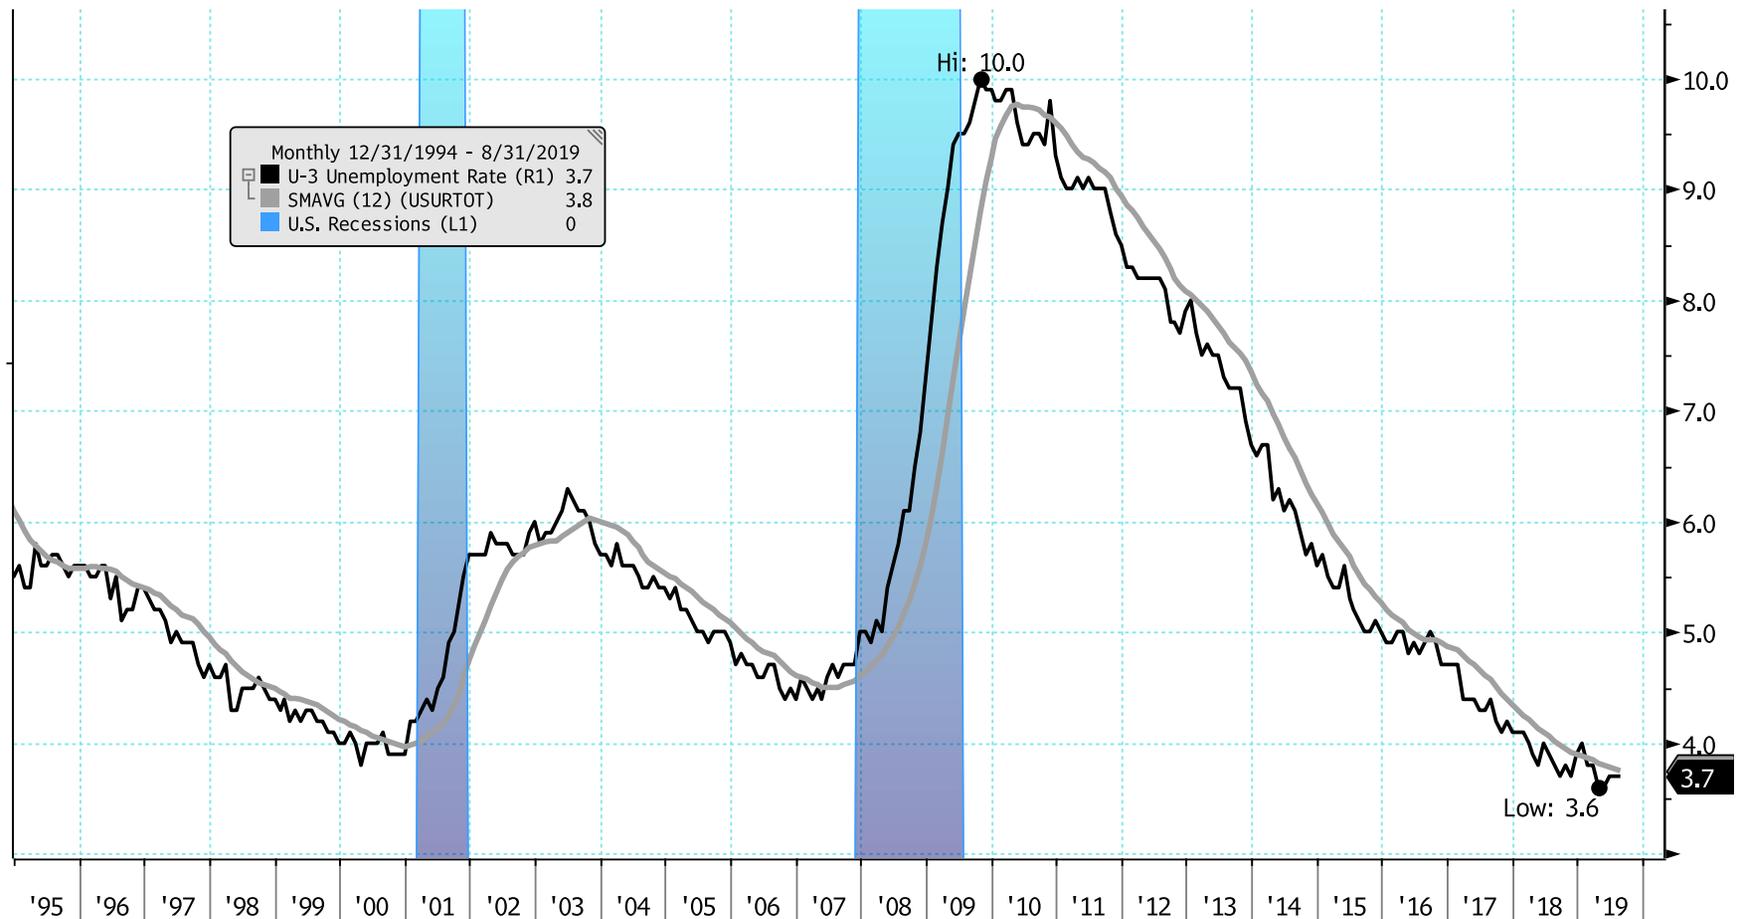

Source: Bloomberg, © Merk Investments LLC

*Analysis: The 3-month moving average of job gains is 156k. Framework: I'd get incrementally negative on this picture if the 3-month average for job gains fell below 135k.*

## U.S. Unemployment Momentum

U-3 Rate and U-3 12 month Moving Average

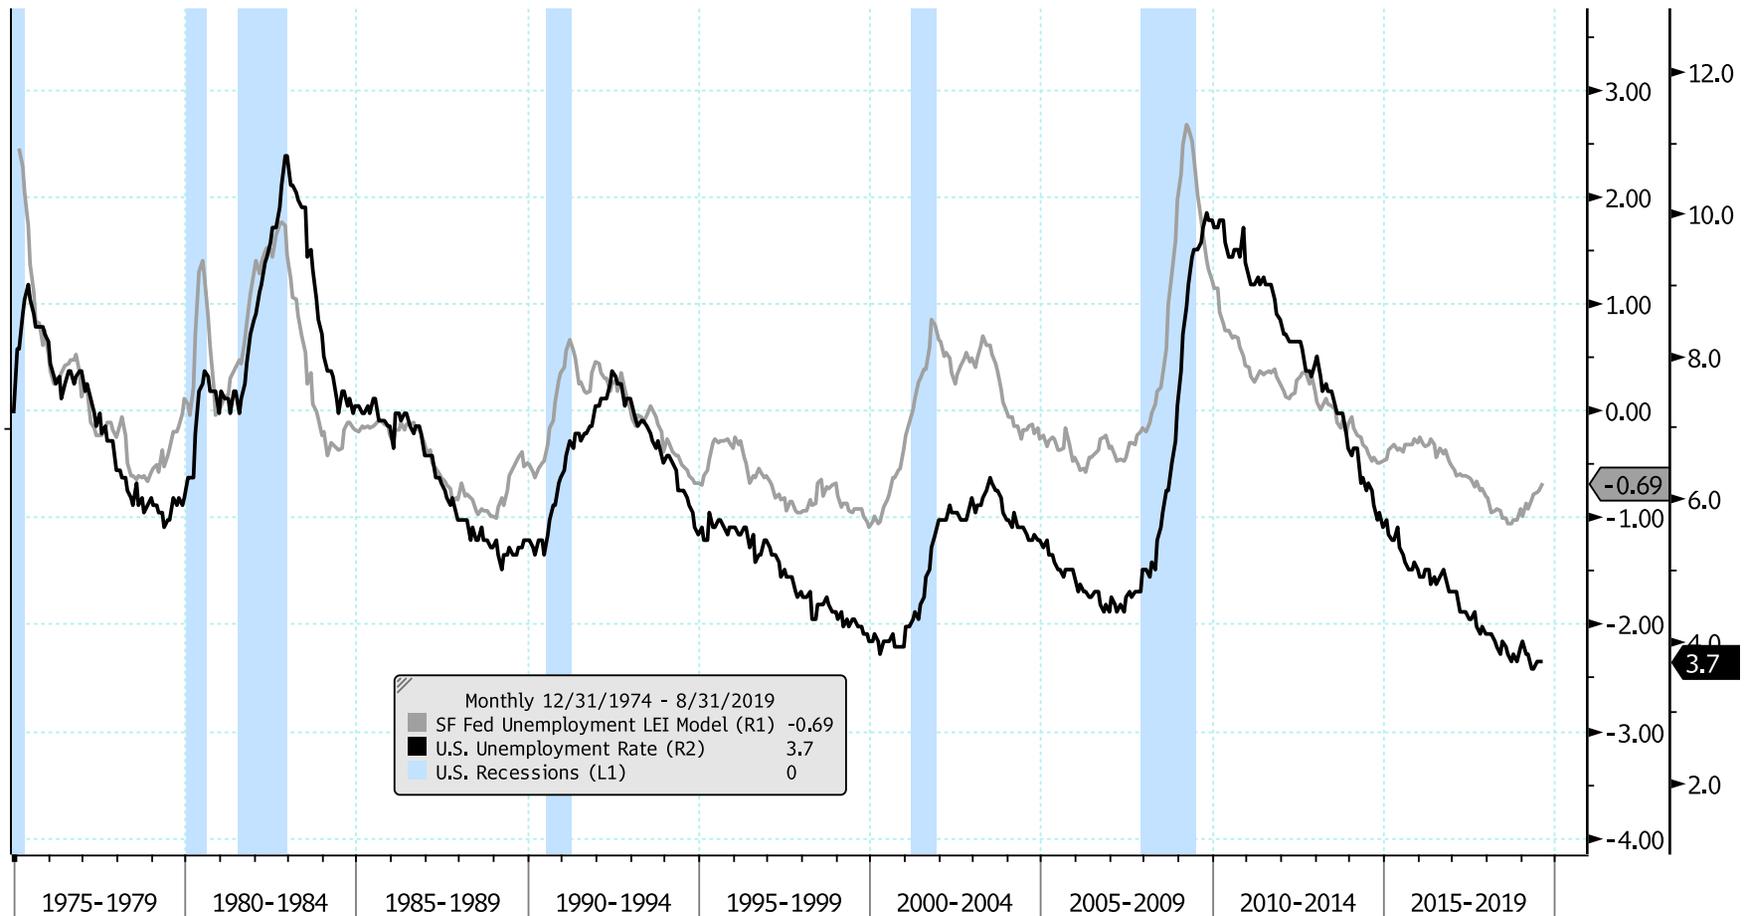

Source: © Merk Investments, Bloomberg

*Analysis: The unemployment rate remained stable at 3.7, and is still below the 12-month moving average (labor force participation rate also ticked higher– not shown). Chart Framework: I'd get incrementally negative on the business cycle outlook if the unemployment rate moved above its 12m MA while the labor force participation rate trended lower.*

### SF Fed Leading Unemployment Rate (U-3) Model

Replica of San Francisco Fed Model (grey) and U-3 Unemployment Rate (black)

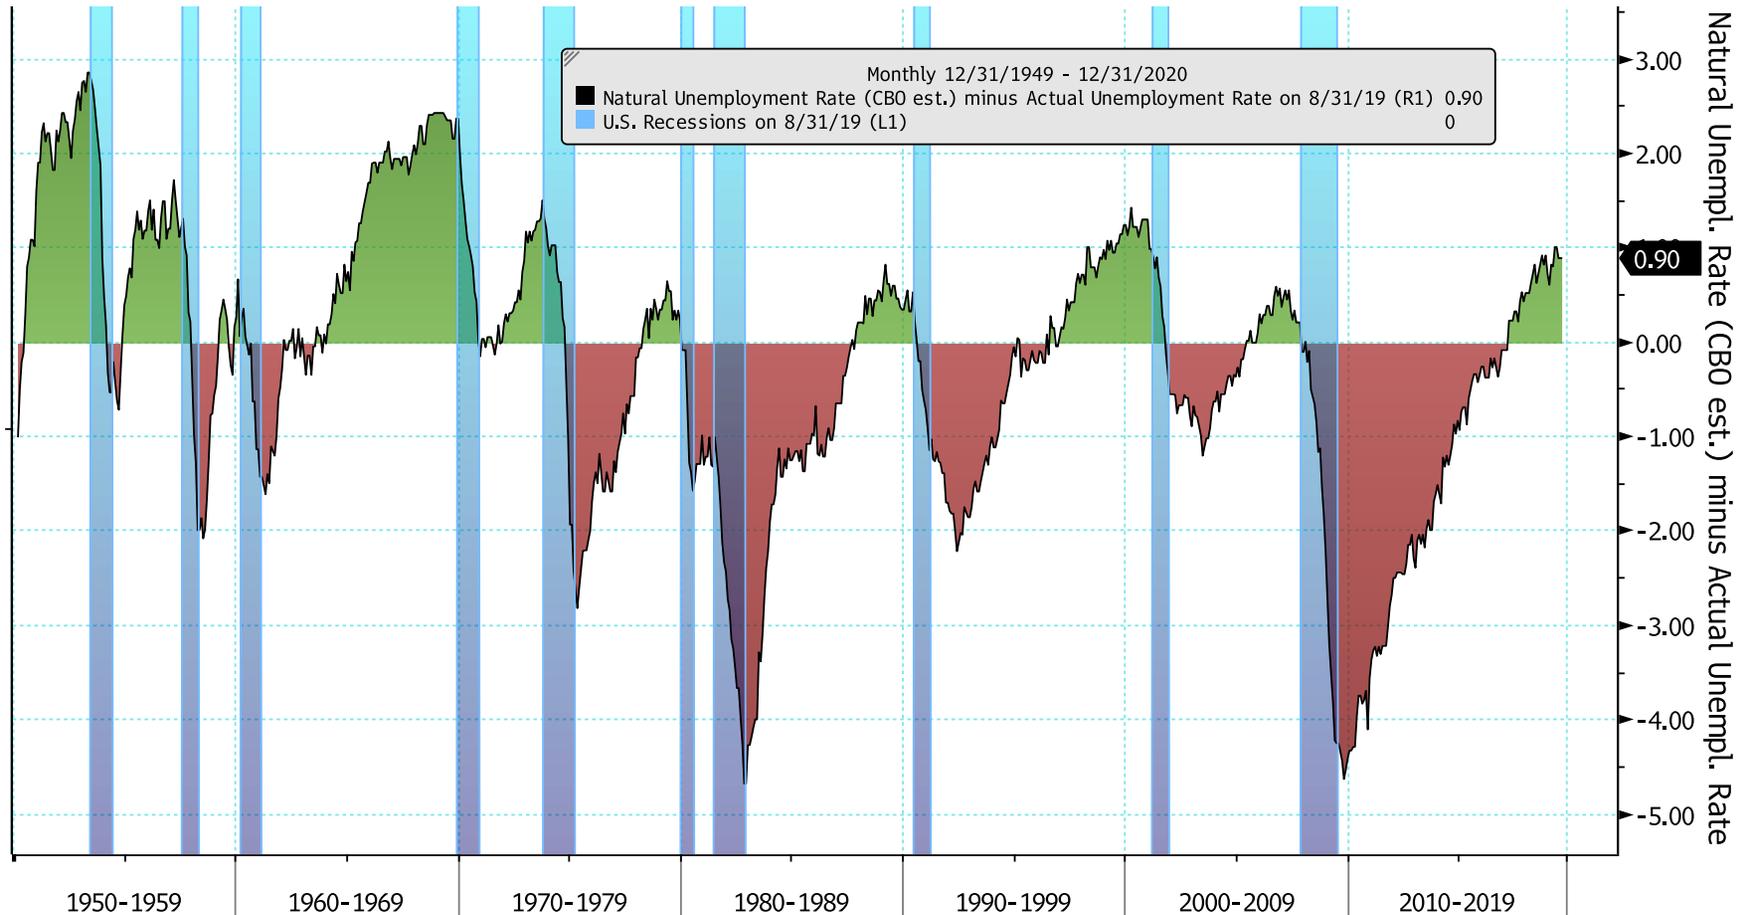

Source: © Merk Investments, Bloomberg

*Analysis: The SF Fed unemployment rate model (grey line) has continued to move higher in recent months, which warrants caution as it might signal that a cyclical turning point in the labor market is coming. Given my chart framework I'm currently negative on this picture. Chart Framework: I'd get incrementally positive on the business cycle outlook if the SF Fed model line started trending lower again on a YoY basis. For reference: [the San Francisco Fed Paper](#)*

## U.S. Labor Market Capacity Utilization

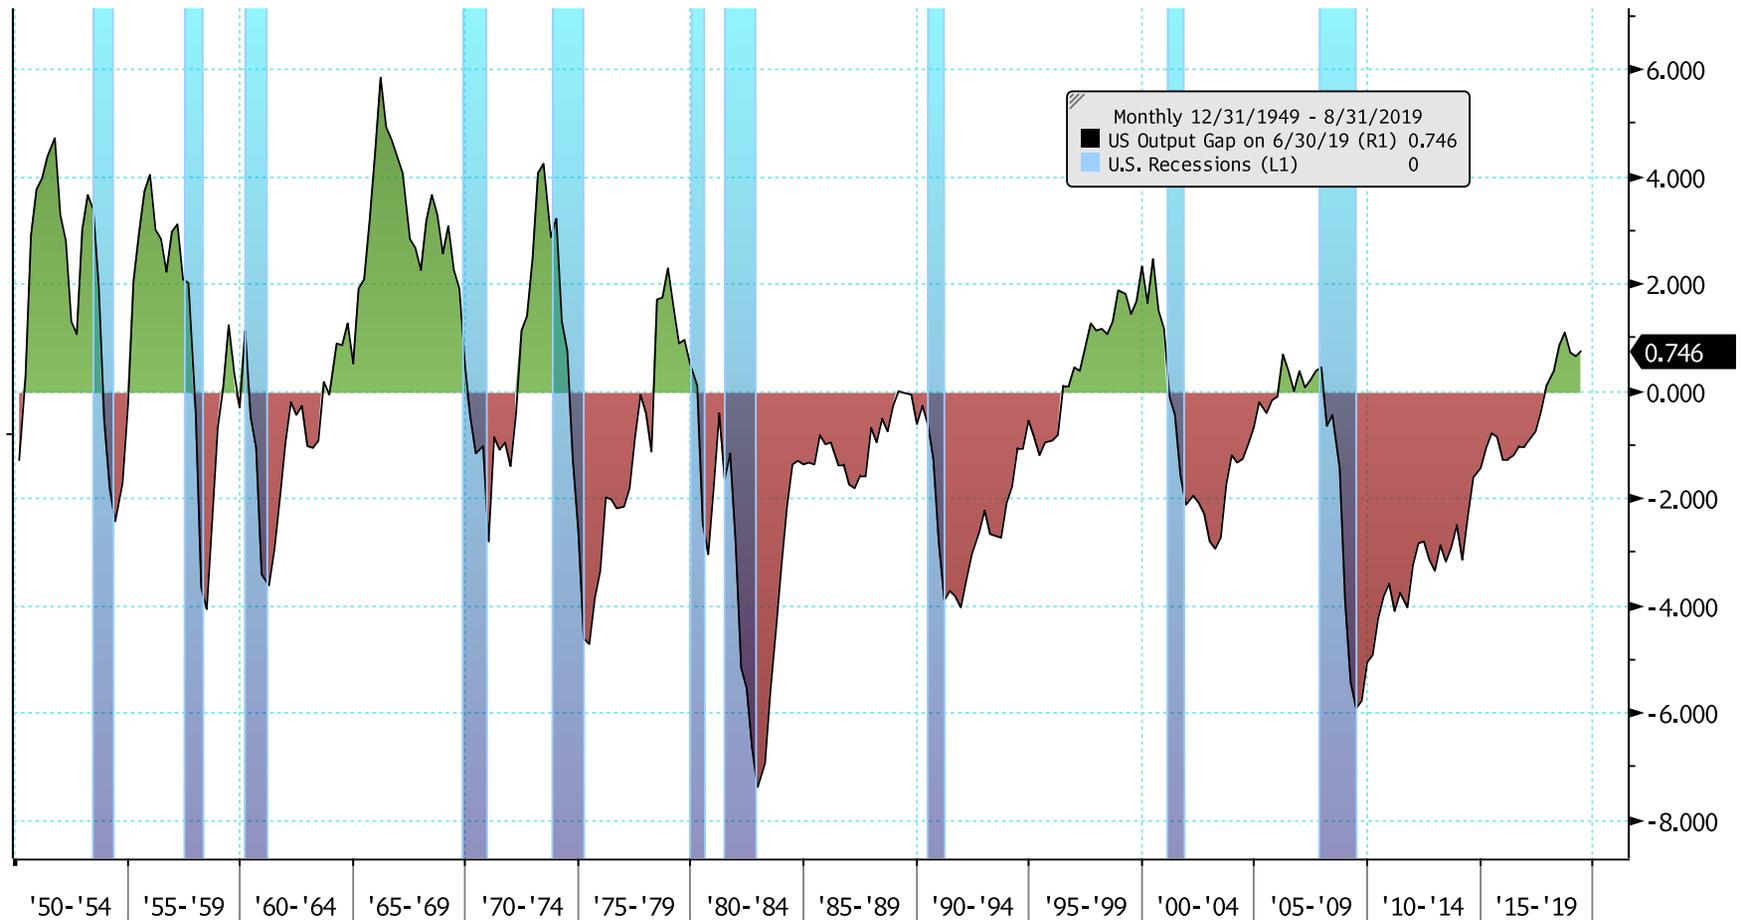

Natural Rate of Unemployment (CBO est.) – Actual Rate of Unemployment

Source: © Merk Investments, Bloomberg

*Analysis: The estimated natural rate of unemployment is higher than the current unemployment rate (4.6% estimate – 3.7% current reading), meaning the U.S. economy is potentially running above capacity, which likely increases the risk of a recession roughly 1-5 years out. It is worth noting that the estimate of the natural rate of unemployment is debated, and some think it is lower than the 4.6% estimated by the CBO. Chart Framework: I'm currently incrementally negative on the business cycle outlook medium/longer term based on this picture, I'd get incrementally positive medium/longer term around -1.00 on the chart, which would likely only be during or after a recession. It's worth noting that despite the current picture above many other metrics seem to indicate that some slack remains in the labor market.*

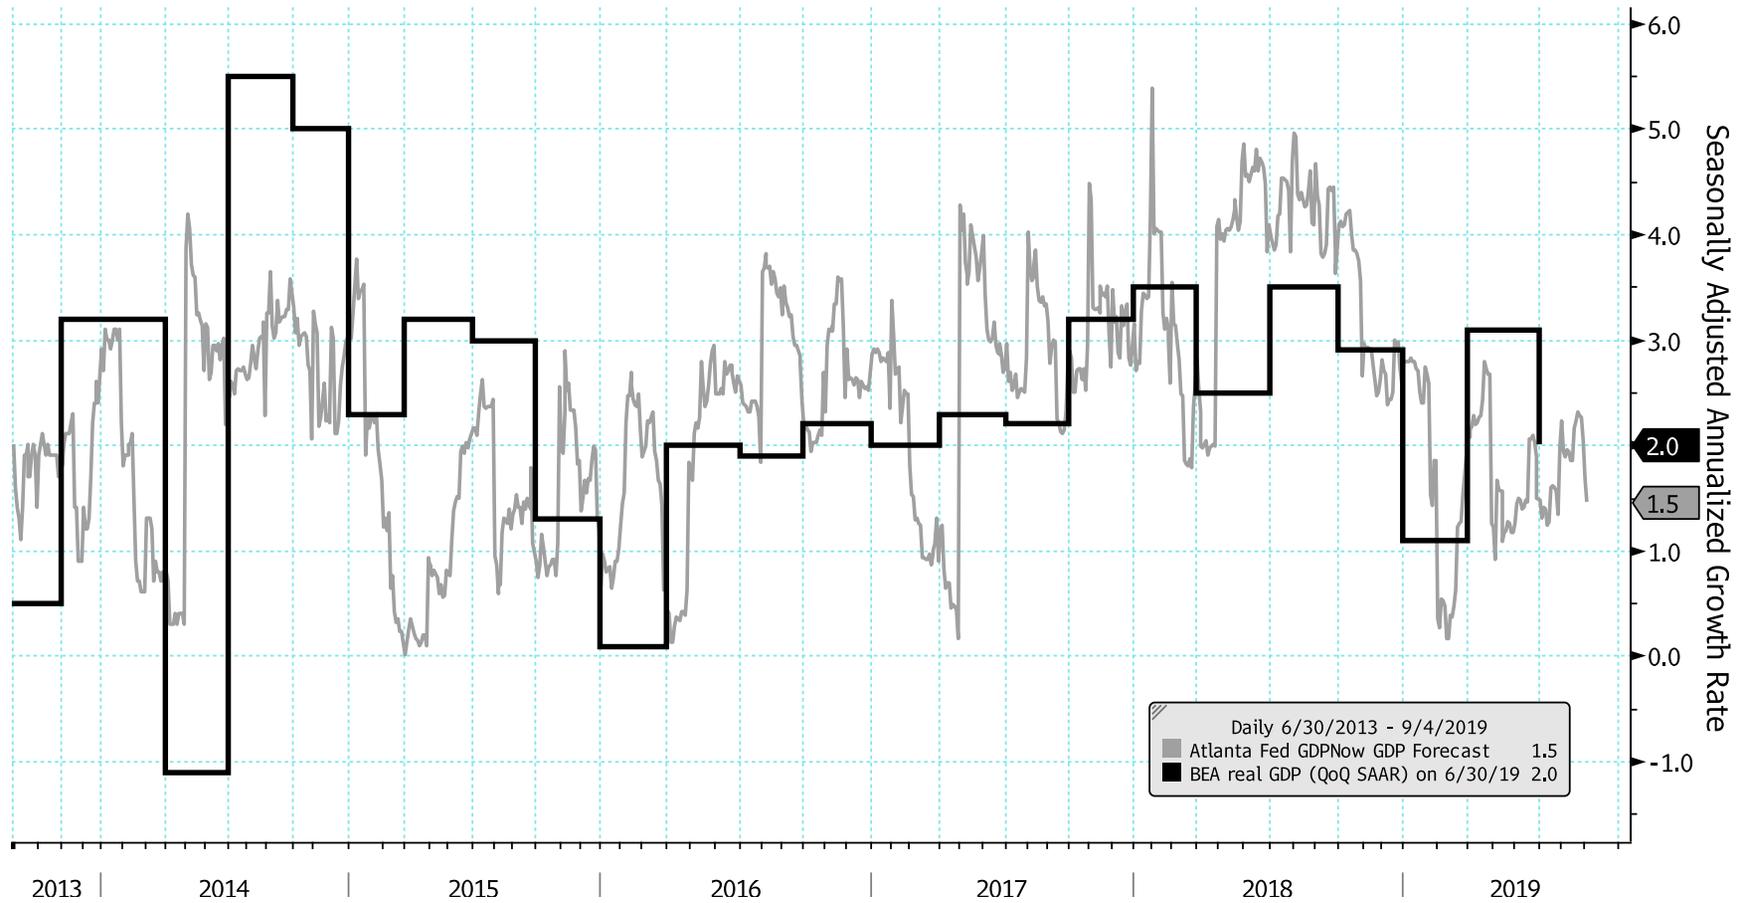

### U.S. GDP Output Gap Actual GDP minus Potential GDP (CBO est.)

Source: © Merk Investments, Bloomberg

*Analysis: Actual GDP is more than potential GDP (as estimated by the CBO), which suggests the expansion may be in its late stages. As with the unemployment rate on the previous page, there is debate about what potential GDP should be. I'm currently incrementally negative on the business cycle outlook medium/longer term based on this picture. Chart Framework: I'd get incrementally positive medium/longer term around -2.0 on the chart, which would likely only be during or after a recession.*

### Atlanta Fed GDPNow GDP Forecast GDPNow Forecast and the official QoQ SAAR from BEA

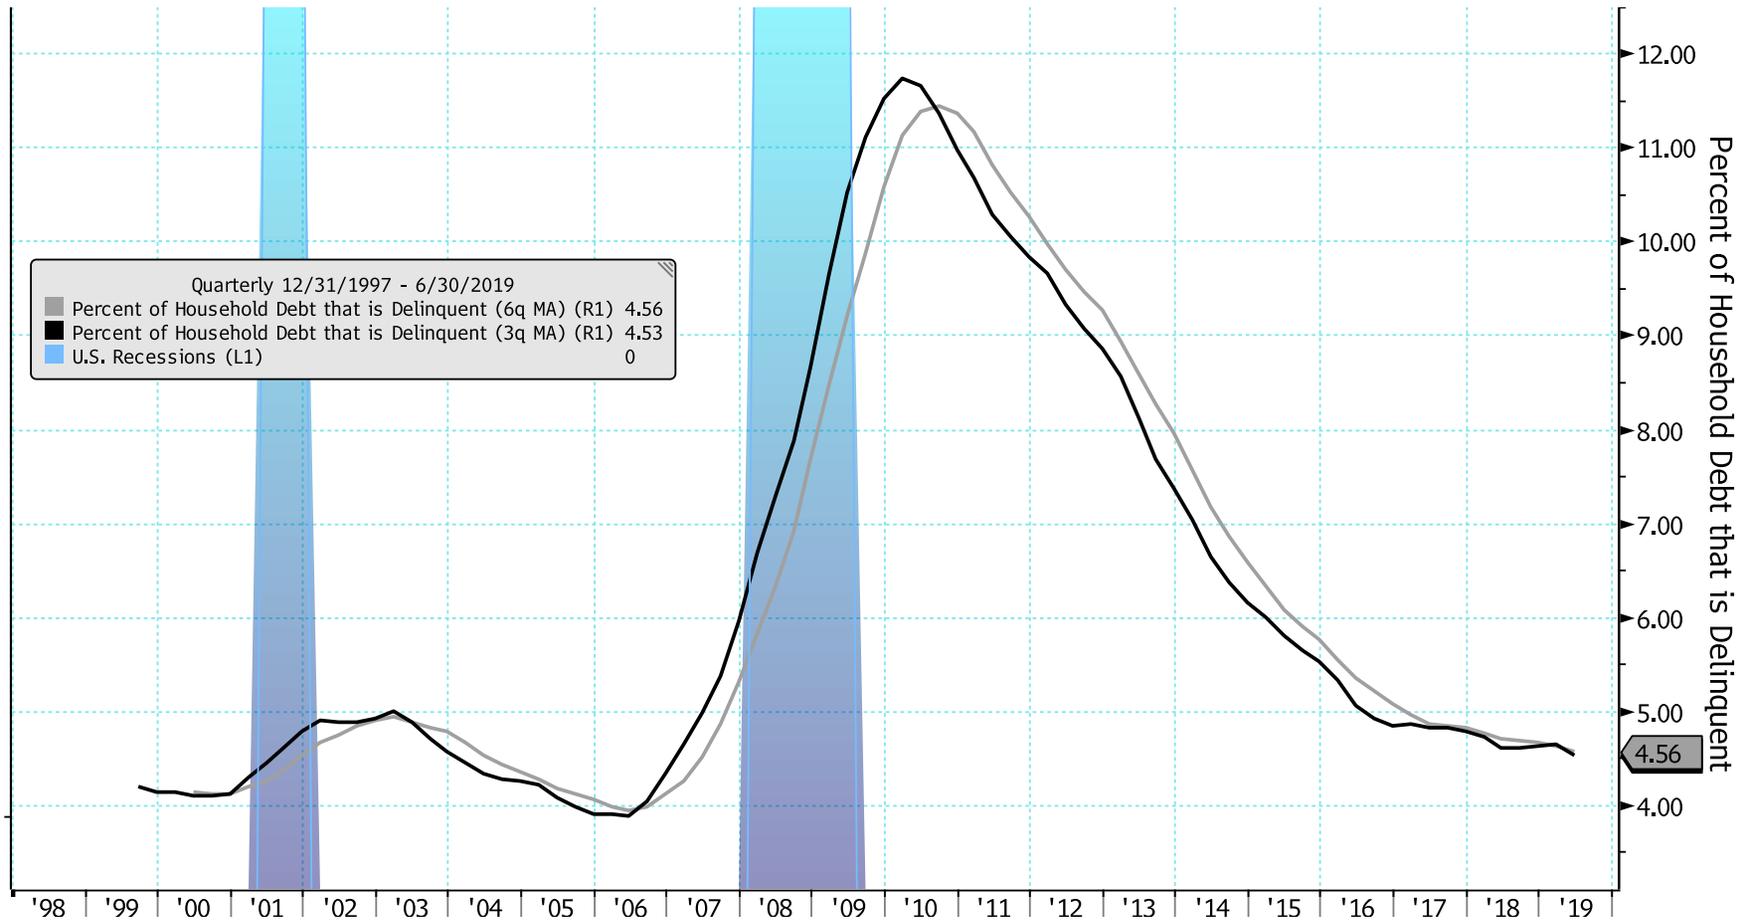

Source: © Merk Investments, Bloomberg

*Analysis: The Q2 2019 GDP reading (black line) came in at 2.0%, the current forecast for Q3 2019 GDP is around 1.5%. Chart Framework: I'd get incrementally negative on the business cycle outlook if the Atlanta Fed GDP indicator fell below zero.*

## U.S. Household Credit Cycle

Percent of Household Debt that is Delinquent (3 quarter and 6 quarter moving averages)

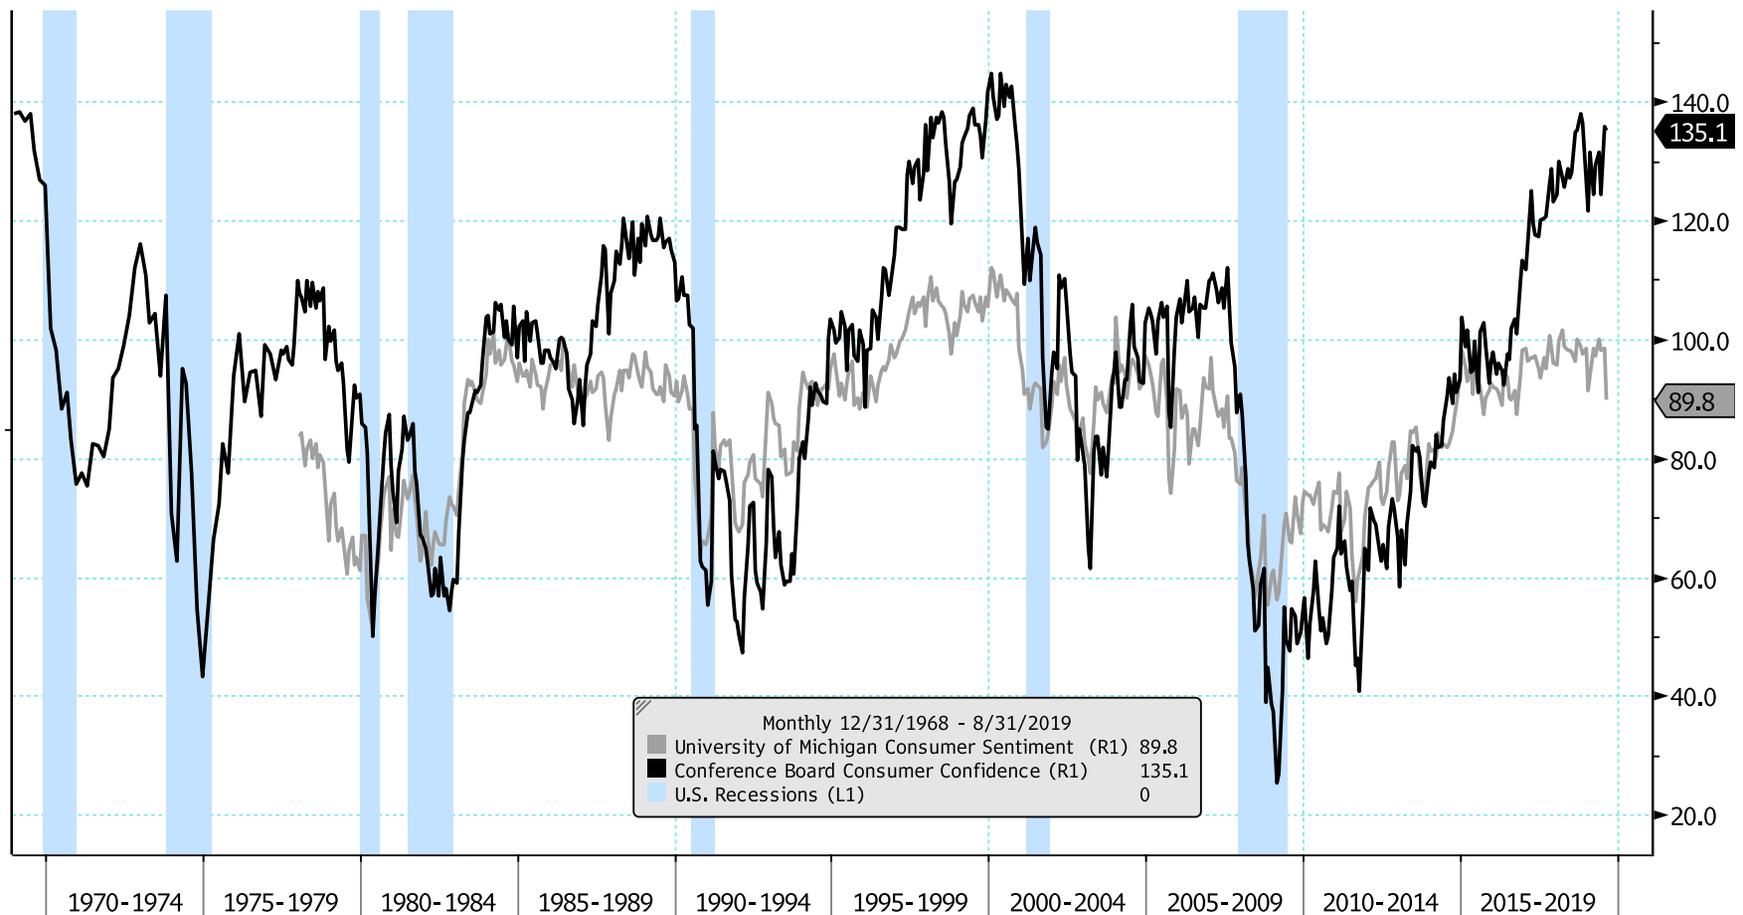

Source: © Merk Investments, Bloomberg

*Analysis: The Q2 2019 data showed another downtick in the household delinquency rate (generally a positive sign for the economy); and the 3-quarter moving average (black) moved back below the 6-quarter moving average (grey). Given my chart framework I'm currently positive on this picture. Chart Framework: I'd get incrementally negative if the 3q MA rose above the 6q MA. The Q3 2019 data comes out in late November.*

## U.S. Consumer Confidence

Michigan Consumer Sentiment and Conference Board Consumer Confidence

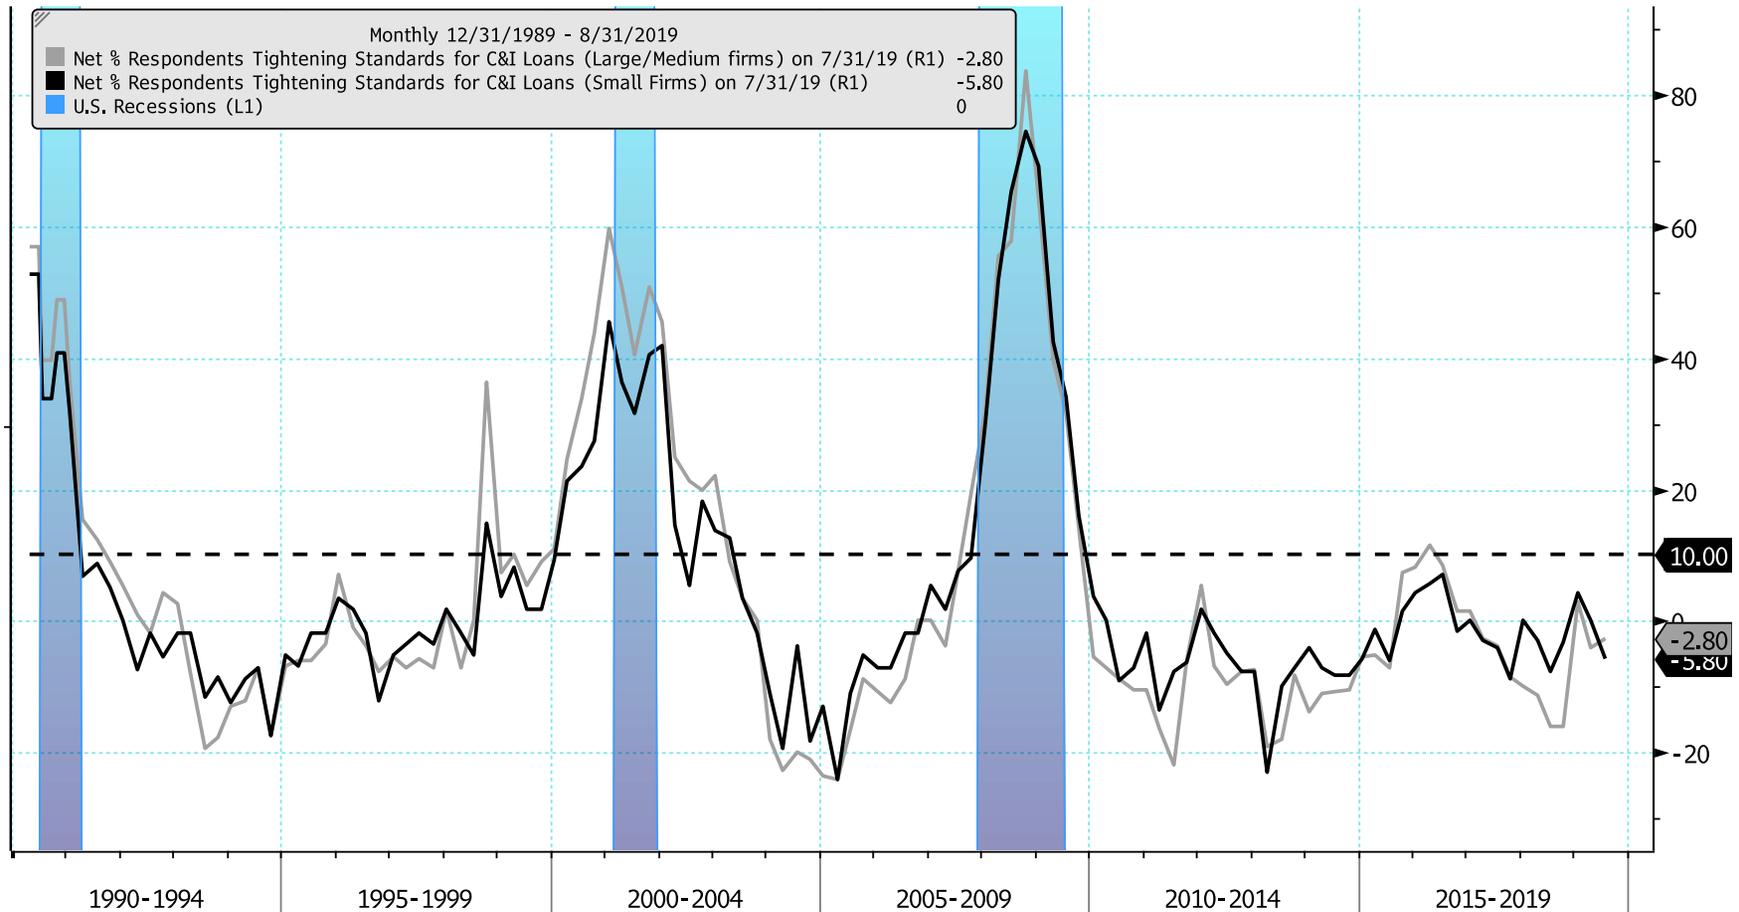

Source: © Merk Investments, Bloomberg

*Analysis: The consumer confidence indexes are mixed, with one trending higher and one trending lower. In any case, they are both at elevated levels, which can be a longer term contrarian indicator. Given my framework, I'm currently neutral/negative on this picture. Chart Framework: I'd get incrementally positive if both measures are trending higher on a YoY basis.*

## Bank Lending Standards

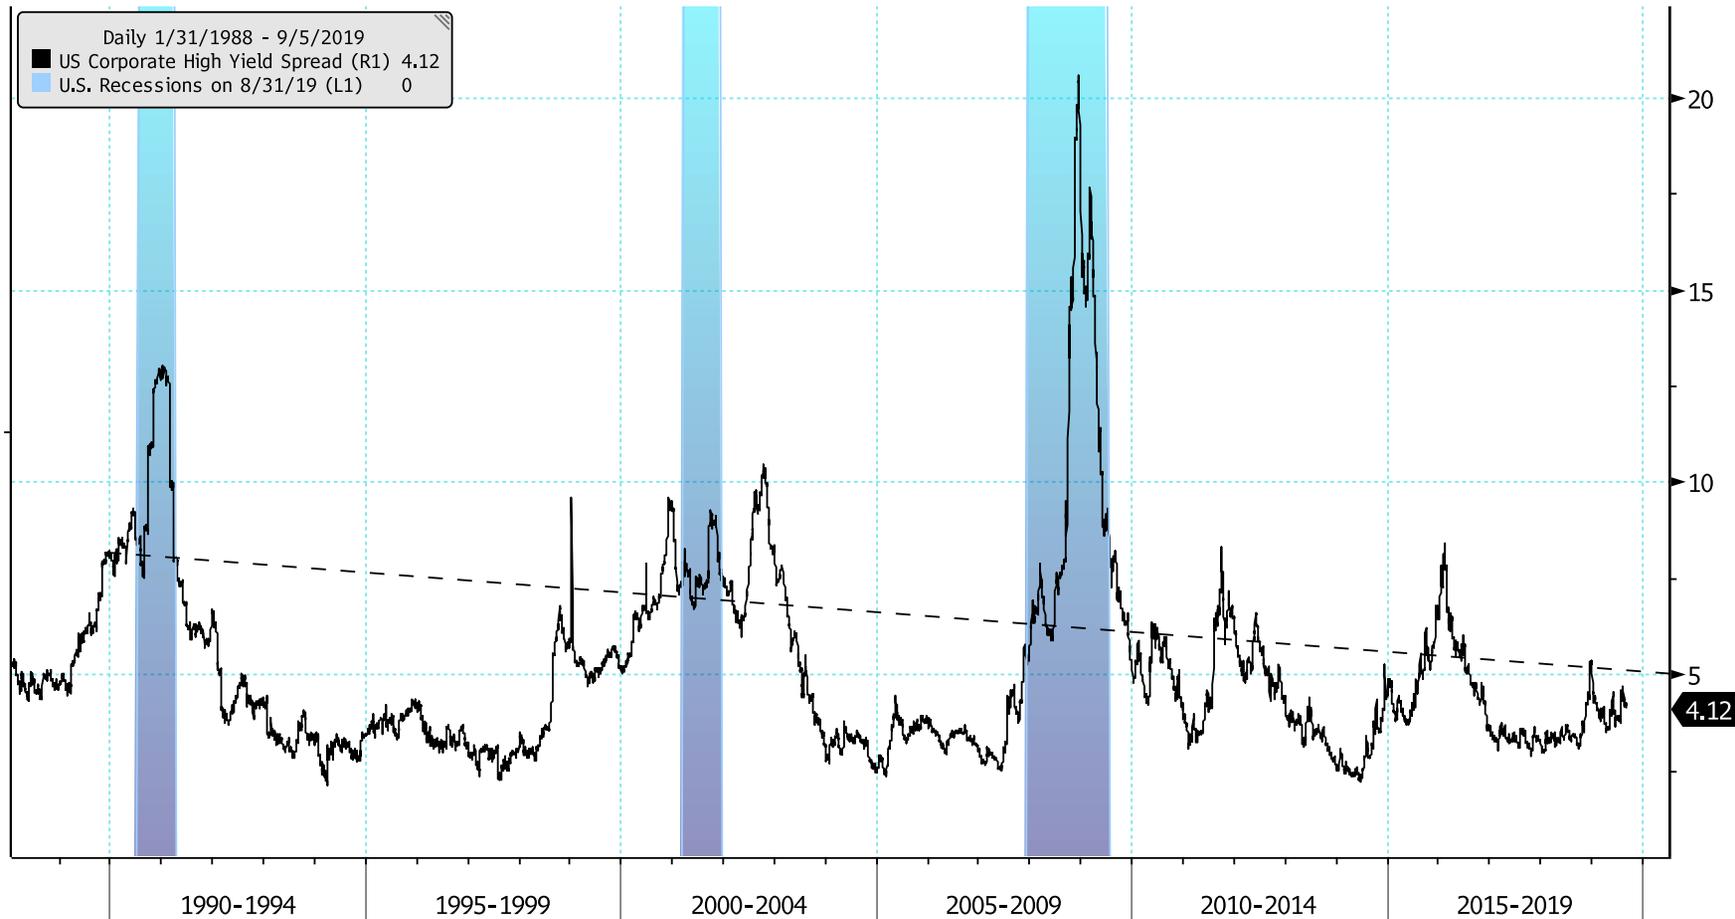

Senior Loan Officer Opinion Survey (SLOOS): Net % of Respondents that are Tightening Lending Standards for Commercial and Industrial (C&I) Loans

Source: © Merk Investments, Bloomberg

*Analysis: Data from the Fed's Senior Loan Officer Opinion Survey suggest bank lending standards generally continue to be supportive of economic activity. Chart Framework: I'd get incrementally negative on the business cycle outlook if 10% of respondents report tightening lending standards. It's worth noting that this data only comes out quarterly, and with a lag.*

## High Yield Spread US High Yield Spread with Trend Line

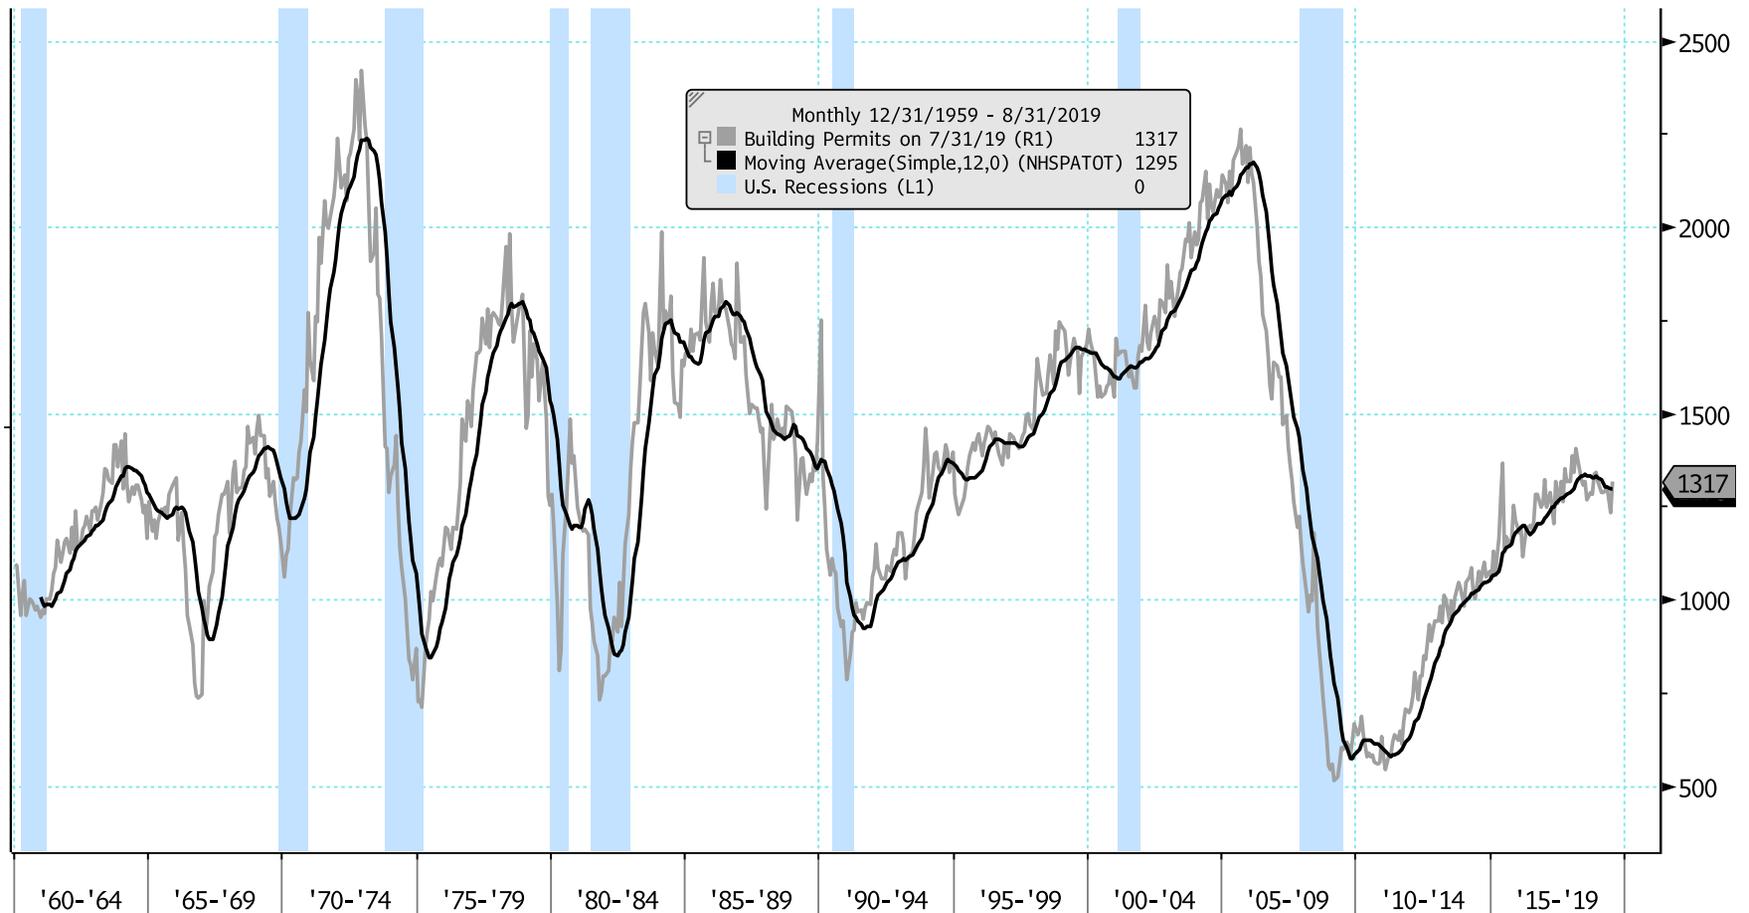

Source: © Merk Investments, Bloomberg

*Analysis: The high yield credit spread remains below what I consider to be the warning level, although it has been trending higher and bears watching. Chart Framework: I'd get incrementally negative on the business cycle outlook if the spread moves above 5.*

# U.S. Building Permits

U.S. Building Permits and 12-month Moving Average

Source: © Merk Investments, Bloomberg

*Analysis: Building permits, historically a long leading indicator, are starting to look like they may have topped for the cycle- another potential late cycle indicator. I'm currently neutral/negative on this picture. Framework: I would get positive if the 12-month moving average started trending higher again.*

## Checklist

Chart	Time Horizon	Per Framework Outlook on Business Cycle
LEIs	Short/Medium Term	Positive
Yield Curve	Medium Term	Neutral/Negative
U.S. PMIs	Short/Medium Term	Negative
Global PMIs	Short/Medium Term	Negative
Job Gains	Medium Term	Positive
U-3 v 12m MA	Medium Term	Positive
SF Fed U-3	Medium Term	Negative
Labor Force Capacity Util.	Medium/Longer Term	Neutral/Negative
Output Gap	Medium/Longer Term	Neutral/Negative
GDP Forecast	Short Term	Positive
Household Credit	Medium Term	Positive
U.S. Consumer Confidence	Short/Medium Term	Neutral/Negative
Lending Standards	Medium Term	Positive
High Yield Spread	Short/Medium Term	Positive
U.S. Building Permits	Medium/Longer Term	Neutral/Negative
	Time Horizon	Overall Outlook on Business Cycle
	Short Term (<6 months)	Neutral/Positive with high uncertainty
	Medium/Longer Term (6m - 5 years)	Neutral/Negative with high uncertainty

## Conclusion/Thoughts

This continues to be a challenging economic environment to analyze, with mixed signals. I would estimate the probability of a recession starting in the coming six months to be around 30-40%. While my base-case view remains that the U.S. economic expansion will likely continue over the next several months, and in general until further notice, the trend in much of the data is concerning and the data probably needs to start improving soon if the U.S. economy is going to weather the current soft patch.

Of greatest concern are the depth and duration of yield curve inversion (10yr-3m) and the weakness in the U.S. manufacturing PMI (now below 50). On the positive side: the LEI index continues to trend higher YoY, financial conditions continue to be generally supportive of the expansion, and the labor market continues to be relatively strong. Even given some of the late cycle indications, some slack seems to remain in the labor market, which may further suggest that the economic cycle can continue for a while longer. Also, historically U.S. business cycles have ended with an "overheating" and an overshoot of inflation- the U.S. economy has not (yet) "overheated" and there seems to be an absence of obvious excesses.

Much of the weakness in global manufacturing is likely attributable to uncertainty over global trade policy, an issue that the current U.S. administration seems to have a fair amount of unilateral influence over. In my view the administration will likely make an effort to move toward resolution as the re-election campaign approaches, which may be the catalyst for a global economic rebound. The more time passes before a resolution the more likely a resolution could be too little too late with regards to avoiding a recession.

While uncertainty around the outlook has increased greatly, based on my checklist approach I think the U.S. business cycle picture near-term is overall still slightly more positive than negative. On balance, based on the charts and frameworks presented (which inevitably may not capture all possible risk factors in real-time), it seems more likely than not that the U.S. economic expansion continues in the coming several months. The longer term outlook remains negative as we are likely in the late part of this economic expansion. All of the presented charts and concepts are somewhat inter-related, as is the economy in general, so the idea is to have some different data points to cross-reference. In my view no one indicator can be looked at in isolation.
